

Beomjin Kim

Production-oriented Full-stack Engineer

Target role: Senior Application Support Engineer, Sales & Delivery Applications

Total experience 5+ years 010-8849-8539 hypnos709@gmail.com GitHub LinkedIn

Professional Summary

Full-stack engineer with 5+ years of experience across mobile, web, backend APIs, database-backed workflows, payment reliability, internal tooling, and automation. I have worked on production-facing systems where user flows, API contracts, data consistency, payment state, real-time messaging, and operational verification had to align. My strongest fit for Tesla is the combination of application development, incident-style problem solving, database/log-oriented analysis, and building tools or process improvements that reduce repeated operational work and third-party dependency cost.

Fit for Tesla Application Support

Production Issue Analysis

Redesigned a payment flow after analyzing double-payment, missing-order, timeout, and data consistency risks.

SQL / Database-backed Systems

Worked with PostgreSQL, Supabase, Oracle redo logs, data synchronization, and data pipelines.

Real-time System Design

Implemented and released an in-house chat service covering Socket.IO, Redis synchronization, message ordering, reconnect recovery, push routing, and staged cutover.

Sales / Order Workflow Experience

Built order creation, payment verification, refund policy, transaction handling, and status tracking flows.

Support Tooling and Automation

Built development automation, test generation flows, documentation automation, and internal viewer/tooling around logs and workflows.

Skills

Application Support	Production issue analysis, root-cause-oriented debugging, containment design, long-term resolution planning, cross-functional communication
Backend / Data	NestJS, FastAPI, PostgreSQL, Supabase, REST API design, data modeling, transaction and payment state design, real-time messaging architecture, SQL querying and analysis
Frontend / Mobile	Flutter, React, Next.js, TypeScript, Riverpod, BLoC, React Query, responsive web, shared UI systems
Platform / Infra	AWS, Firebase, GitHub Actions, Fastlane, Socket.IO, Redis Pub/Sub, Kafka, ECS Fargate, networking fundamentals, databases, CI/CD, application monitoring concepts
Automation	Python, C, Claude API, MCP, AI Agent Harness, Swagger-based code generation, test automation, documentation automation
Languages	Korean native, English professional working communication

Professional Experience

2024.12 - Present

Munto

Frontend / Full-stack Engineer

Worked across web, mobile, backend order/payment flows, common modules, and development automation while the product expanded from mobile-first usage to web and multi-service experiences.

Web MAU 80K to 120K, total MAU 250K+

Production Reliability / Payment Flow

- Analyzed double-payment and payment-completed/order-missing risks caused by client-side payment confirmation and unstable order state transitions.
- Redesigned the flow so the server owns order creation, payment verification, transaction handling, refund policy, and final payment state decisions.
- Introduced a WAITING_PAYMENT state and order-level idempotency so retry and re-entry flows resolve against the same order instead of creating inconsistent payment attempts.
- Handled payment provider confirm timeouts with PROCESSING responses and order-status polling instead of prematurely failing user-visible payment flows.
- Released the server-side payment structure and prevented recurrence of the same duplicate payment issue after launch.

Application Architecture / Business Operations

- Built web service detail and VOD streaming flows that could be reused between mobile web, desktop web, and in-app webview contexts.
- Separated server state with React Query cache and local UI state with hooks and Context API to reduce coupling between business data and screen state.
- Built an in-house chat service replacing Sendbird, including separate REST/WebSocket deployments, Socket.IO messaging, PostgreSQL persistence, Redis Pub/Sub multi-node synchronization, message-id-based ordering, read-cursor unread counts, push SLA design, and staged cutover.
- Shifted the first 500-user chat segment from Sendbird to the in-house service, reducing SaaS cost by approximately \$300/month in phase 1 and enabling an estimated additional \$1,700/month reduction in phase 2 by migrating 30-50% of total chat usage.
- Designed the munto-core common package for shared network, authentication, token, storage, logging, internationalization, Firebase, and chat SDK initialization modules.
- Collaborated across product, design, backend, and business contexts to translate user flows into API contracts, data models, and releaseable application behavior.

Automation / Process Improvement

- Established a standard development process from planning/SRS to WBS, DBML, Swagger, TCL, implementation, and verification.
- Built an AI agent harness that reproduces the same development workflow across Claude, Cursor, and Codex, improving deliverable completion time by approximately 60%.
- Automated repetitive implementation, test, and documentation work through structured agent workflows and shared source rules.

2024.06 - 2024.09

Milk Corporation

Frontend Engineer

Developed secondhand commerce features for a kids shopping platform, focusing on user transaction flows, network structure, and UI performance.

- Implemented listing, browsing, purchase, and settlement-related client flows for secondhand transactions.
- Introduced an API layer with common interceptors and error handling to make network behavior more consistent and supportable.
- Reduced home-screen frame drops by moving scroll event handling out of state-heavy view model updates and into the view layer.
- Refactored GetX-based structure into BLoC, separating UI concerns from business logic.

2022.09 - 2024.03

Cenacle Soft

Flutter Engineer

Built B2C healthcare app features and mobile patient chart functionality from early launch stage.

- Developed healthcare record, body measurement, menstrual calendar, hospital reservation, EMR integration, and mobile patient chart flows.
- Separated server DTOs from application models and designed factory-based chart models for heterogeneous health data.
- Implemented an interactive CustomPainter chart system with zoom, date selection, and animated transitions for blood pressure, weight, and BMI data.
- Applied Riverpod and Hooks to separate business state from widget-local interaction state.

2020.04 - 2022.04

WeDataLab

Software Engineer

Worked on DB monitoring solutions, system-level communication modules, internal tools, and Flutter applications.

- Developed an Oracle redo log-based data synchronization module for database monitoring and replication-related workflows.
- Managed Oracle Pro*C build and executable generation flows.
- Built socket communication and semaphore-based log transfer modules in C.
- Developed a Python/PyQt log viewer tool for internal inspection and debugging workflows.
- Built two internal Flutter applications.

Selected Projects

2025.04 - Present

aidy

AI music generation and seed-trading platform

- Designed PRD, ERD, backend APIs, app flows, and payment structure as a solo full-stack project.
- Integrated Suno API proof-of-concept flows and reviewed storage and streaming architecture.
- Designed an economy model involving prompt combinations, user rewards, paid purchases, and subscription concepts.

2024.08 - 2025.01

ABO

Fantasy baseball web project based on real KBO game data

- Collected Statiz player data and built the player database.
- Built data processing pipelines for fantasy-game scoring logic.
- Designed and implemented the web page, backend, database, and scoring system; operated the project for one year.

Education

2016.03 - 2023.08

Sungkyunkwan University

B.A. in Philosophy, B.S. in Computer Science and Engineering

Keywords: application support, production support, order/payment systems, SQL, database analysis, REST APIs, real-time messaging, Redis, Socket.IO, incident analysis, internal tools, automation, cross-functional support.
